

DELAWARE PUBLIC SERVICE COMMISSION
DOCKET 06-241
PUBLIC COMMENT
Wednesday, August 30, 2006

To Ms. Karen Nickerson:

Dear Ms Nickerson,

I am writing to comment on the abusive and dangerous emissions emanating from the three coal-fired power plants in Delaware.

The health issues connected with these toxic emissions are well documented. For one; a Feb.9, 2005 letter from Dr. Rivera, Director of the Delaware Division of Public Health.

These pollutants cause asthma, heart disease, strokes, cancer, birth defects, learning disabilities, premature death and many other respiratory and general health problems.

It is time to consider an alternative source of power. Dr Willett Kempton has conducted a study of wind potential in Delaware waters. His findings show wind power as a viable alternative. Wind power is clean, safe. And best for the planet.

Please, let's explore this possibility. Developing wind power and closing the old coal plants is do-able, logical, and the humane thing to do.

Thank you for your time.
